

ABSTRACT

A binding cloth for medium or low frequency wave massage includes a plurality of conductive strips secured within a binding cloth on selected locations. Each conductive strip has a first end
5 connected with a conductive plate and a second end connected with a conductive button. The conductive buttons are concentrated on a selected location of the binding cloth for being buckled up with a plurality of corresponding conductive buttons on an electro-stimulating controller so that the controller is
10 mounted onto the binding cloth. Having the conductive plates applied to the human body, the electro-stimulating controller activates the binding cloth to provide the effect of medium or low frequency wave massage.
